Autodesk has been a leading software company since the early 1960s, developing and marketing top-selling computer software applications, including AutoCAD and AutoCAD LT. The growth and success of Autodesk have made AutoCAD one of the world's leading computer-aided design and drafting (CAD) software products, which are used by architects, engineers, drafters, artists, interior designers, mechanical, electrical, civil, and landscape architects. The software has also been used by other sectors, including universities, medical and architectural firms, government organizations, and military and non-profit organizations. AutoCAD software is designed for non-specialists with an undergraduate degree, and is available in both a desktop and a mobile version. The AutoCAD software includes a suite of specialized tools for design, modeling, fabrication, and analysis, as well as 2D and 3D vector drawing and drafting. A digital prototype version of AutoCAD is also available for a low monthly fee, which allows architects and other professionals to quickly visualize changes to a design with confidence, providing the capability for sketching, wireframing, and 3D modeling. The latest version of AutoCAD software is AutoCAD LT. AutoCAD History In 1963, I. Michaelis, the President of AutoDesk, Inc., began producing AutoCAD software for the desktop on Xerox Alto, which was the first interactive computer developed at Xerox. I. Michaelis developed the first architecture software on the Alto, and the first ever CAD software was a modified version of I. Michaelis's architectural software, running on a minicomputer. In 1982, Autodesk's Autodesk 2D AutoCAD was introduced, and it changed the world of CAD by introducing the first desktop CAD product for personal computers. Unlike the industry leaders of the time, Autodesk began as a development company, publishing the first AutoCAD only after it had gained wide commercial success. AutoCAD became a leading industry leader in the 1980s, with the release of AutoCAD 2000. This version was the first to include the 3D modeling and construction tools now found in AutoCAD. AutoCAD 2000 brought features such as the ability to work with a single 3D drawing at a time, as well as the ability to move the viewport or a user-defined point inside a

More particularly, the invention is directed to a system in which a transmitting node encodes and transmits data over a channel that passes through a network of secure nodes. The receiving node decodes the data before passing the information to a final recipient. Information and communication systems continue to grow at ever-increasing rates. In turn, the need for efficient data exchange has increased correspondingly. However, in these systems, the integrity of the data is an important factor. For example, in a commercial environment, one or more parties transmit and receive information over electronic or telephonic communication channels. This communication between parties often involves electronic commerce (xe2x80x9ce-commercexe2x80x9d) or payment transactions. Information is also exchanged over insecure communication channels. For example, credit card information is transmitted in this manner. As a result, a vast array of security measures have been developed to protect the transmission of the data. In turn, these security measures have had a substantial impact on the transfer of information in communications systems. In many secure communication systems, it is desirable for the information to be securely encoded and transmitted. Typically, the encoding and transmission is accomplished at one node in the communication system and the decoding is accomplished at another node in the communication system. However, the security measures that are used in secure communication systems are often not compatible with the encoding/decoding process. For example, in the field of communication systems, secure encoding has been used in wireline and wireless communication systems. However, the secure encoding may not be compatible with the encoding/decoding process used in the wireline and wireless communication systems. For example, secure encoding may be used in the wireline communication systems that employ the aforementioned encoding/decoding process in which the
